
ENERGY IN
OUR
COMMUNITIES

Energy in our South African communities

Energy is part of our everyday lives. We can learn about energy by observing our homes, schools and communities.

Local Examples

- The Sun provides light and heat for drying clothes and warming our homes.
- Families may use firewood or other fuels for cooking, where appropriate.
- Solar panels can provide electricity in homes, schools and community buildings.

Local examples cont...

- Solar panels can provide electricity in homes, schools and community buildings.
- Learners can investigate how their communities use electricity and how they save energy.
- Community members can share their knowledge of traditional and modern ways of using energy.

In South Africa, people use different energy sources and local knowledge to meet their needs. For example:

- Sunlight: Families use the sun to dry clothes, dry crops and warm water.
- Firewood: In some communities, families use firewood for cooking and heating. Learners should also understand the importance of using fire safely and protecting trees.
- Solar energy: Some homes, schools and community buildings use solar panels to generate electricity.
- Wind: Wind can turn wind turbines to generate electricity.
- Local knowledge: Learners can ask parents, grandparents or community members how people used energy in the past and how these practices have changed.

Thank You, Earth!
